

The female reproductive system is a complex network of organs and glands that work together to produce, nourish, and transport a baby from conception to birth. The main organs of the female reproductive system include the ovaries, fallopian tubes, uterus, vagina, and mammary glands.

The ovaries are small, almond-shaped organs located on either side of the uterus. They are responsible for producing and releasing eggs (oocytes) during the menstrual cycle, as well as producing hormones such as estrogen and progesterone.

The fallopian tubes are two thin tubes that extend from the upper corners of the uterus and are connected to the ovaries. They are responsible for transporting the egg from the ovary to the uterus. Fertilization of the egg typically occurs in the fallopian tube.
