

The male reproductive system is a group of organs that are involved in sexual function and the production of offspring in men or people assigned male at birth. The system includes both external and internal parts. External organs include the penis, scrotum, and testicles, while the internal organs include the vas deferens, prostate, and urethra. These organs work together to produce, store, and transport sperm, which can fertilize an egg produced by the female reproductive system.

The penis is the male organ used for sexual intercourse, it has three parts: the root, the body or shaft, and the glans, which is the cone-shaped part at the end of the penis. The glans, also known as the head of the penis, is covered with a loose layer of skin called the foreskin. The scrotum is a sac-like pouch that hangs behind the penis and contains the testicles, nerves, and blood vessels.
